

This note, that [was found here](#), as a part of [a collection](#) is written (completely with human hands) by [Rupadarshi Ray](#), was created on November 29, 2024 1:48:06 PM, was last modified on June 18, 2026 5:22:36 PM, and was exported on September 7, 2026 3:04:03 PM.

mod p

For any prime p we have a ring morphism

$$\text{mod } p : \mathbb{Z}[X] \rightarrow \mathbb{Z}_p[X]$$

- We know

$$f \text{ reducible in } \mathbb{Z}[X] \implies f \text{ mod } p \text{ reducible in } \mathbb{Z}_p[X]$$

whose contrapositive is

$$f \text{ irreducible in } \mathbb{Z}[X] \iff f \text{ mod } p \text{ irreducible in } \mathbb{Z}_p[X]$$

- This means for an **irreducible** $f \in \mathbb{Z}_p[X]$ the preimage

$$(\text{mod } p)^{-1} f \subseteq \mathbb{Z}[X]$$

contains only irreducible polynomials.

- The converse is false in general

“MTH403.L1#^vz1wwj” could not be found.

Current note has 0 direct children and 0 total descendants.
