

Interpretation of measure preserving endomorphisms

X	$x \in X$	
$B \subseteq X$	$x \in B$	
χ_B	$\chi_B(x)$	check $(x \in B) \in \{0, 1\}$
μ	$\mu(B)$	$\mu(B) = \mu\text{-P}(x \in B)$ is the size of B with respect to μ is the probability of randomly picking a point x in B
$T : X \rightarrow X$ that is μ -invariant	<div style="border: 2px solid #00b09b; border-radius: 10px; padding: 10px; background-color: #e0f2f1;"> <p style="margin: 0;">Definition. Measure preserving endomorp</p> <p style="margin: 5px 0 0 20px;">Let (X, \mathfrak{M}, μ) be a $[0, \infty]$-measure space and</p> <p style="margin: 5px 0 0 40px;">$T : X \rightarrow X$</p> <p style="margin: 5px 0 0 20px;">be a measurable map. Then T <i>preserves the measure</i> μ that is μ is a T-invariant measure or T is μ-preserving transformation if</p> <p style="margin: 5px 0 0 20px;">$A \in \mathcal{A} \implies \mu(T^{-1}(A))$</p> </div>	$\mu(T^{-1}(A)) = \mu(A)$ the size of <i>all</i> points going into A after one iteration is same as the size of A
		$\mu\text{-P}(x \in B) = \mu\text{-P}(Tx \in B)$ probability of picking x which is in B after an iteration = probability of picked x in B
	$f : X \rightarrow \mathbb{R}$	<i>observable</i>

	$U_T(f) := f \circ T : X \rightarrow \mathbb{R}$	
	$\mathfrak{X}_T^{(n)} := f \circ T^n : X \rightarrow \mathbb{R}$ a stochastic process?	
	$\int_X f$	$\mu\text{-E}(f)$ <i>expectation value</i>
	$\mu(B) = \int_X \chi_B d\mu$	$\mu(B) = \mu\text{-E}(\text{check}(- \in B))$
$\chi_{B \circ T^k}$	$\chi_{B \circ T^k}(x)$	$\text{check}(T^k(x) \in B) \in \{0, 1\}$
		$\text{returns}(B) := \{x \in B \mid \exists n > 0 :$
	<ul style="list-style-type: none"> Hence we conclude $\mu(A) > 0 \implies \{T^{-n}(A)$ which is \iff there exists $n, m \in \mathbb{N}, n > m$ $x \in T^{-n}(A) \cap T^{-m}(A) =$ that is there exists points in A return back to A. 	$\mu(B) > 0 \implies \text{returns}(B) \neq \emptyset$ or $\text{returns}(B) = \emptyset \implies \mu(B) = 0$

- Consider the set $A \subset B$ of points that do not return to B

$$A := \{x \in B \mid \forall n > 0 : T^n(x) \notin B\}$$
, so this means points of A do not return to A either. If $T^{-n}(A)$ are *not* pairwise disjoint for all $n \in \mathbb{N}$ then there exists $n, m \in \mathbb{N}, n > m$

$$x \in T^{-n}(A) \cap T^{-m}(A) = \emptyset$$
meaning the point $T^n(x)$ in A returns to A , which contradicts the definition of A . Thus $T^{-n}(A)$ are all disjoint.

$$\text{returns}(B \setminus \text{returns}(B)) = \emptyset$$

(weak form of Poincare recurrence) >
Let (X, \mathcal{A}, μ) be a probability space and $T : X \rightarrow X$ be a μ -preserving transformation and $B \subseteq X$ such that $\mu(B) > 0$.
Then the set of points in B that never returns to B has measure zero.

$$\mu(B) > 0 \implies \mu(B \setminus \text{returns}(B)) = 0$$

☰ (infinite Poincare recurrence) >

Let (X, \mathcal{A}, μ) be a probability space and $T : X \rightarrow X$ be a μ -preserving transformation and $B \subseteq X$ such that $\mu(B) > 0$. Then the set of points in B that returns to B *only finitely many times* has measure zero.

- Now consider the set of points in B that do not return to B *infinitely many times* that is

$$A_\infty := \{x \in B \mid$$

- If we consider the sets

$$A := \{x \in$$

$$A_k := \{x \in$$

for

$$k \geq 1,$$

- We see

$$\iff T^k(x$$

so

$$A_k = T^{-k}(B)$$

for all

$$k \geq 1.$$

- If

$$x \in A_\infty$$

there

must be

a largest

integer k

such

that

$$T^k(x) \in B$$

so

$$x \in A_k.$$

Conversely,

if

$$x \in B \cap A_k$$

, we

know

$$T^n(x) \notin B$$

for all

$$n > k$$

meaning

$$x \in A_\infty.$$

- Thus

$$A_\infty = \bigcap_{k=1}^{\infty} A_k$$

implying

$$\mu(A_\infty) = \lim_{k \rightarrow \infty} \mu(A_k)$$

- And we

have

already

proven

$$\mu\left(\bigcup_{k=1}^{\infty} A_k\right) = \sum_{k=1}^{\infty} \mu(A_k)$$

are all
disjoint

- Consider the set \mathcal{L} of points that do not return to

- Let (X, \mathcal{A}, μ) be a **probability space** and $T : X \rightarrow X$ be a μ -preserving transformation. For a measurable subset $A \subseteq X$, consider the subsets

$$A, T^{-1}(A), T^{-2}(A), \dots$$

which are all measurable subsets of X .

- As

$$T^{-n}(A) \subseteq X,$$

we have

$$\implies \mu\left(\bigcup_{n \in \mathbb{N}} T^{-n}(A)\right) = \sum_{n \in \mathbb{N}} \mu(T^{-n}(A))$$

- But as $\mu(A) = \mu(T^{-n}(A))$, if $T^{-n}(A)$ are all disjoint

sets we
have

$$\mu(X) \geq \sum_{n \geq \ell}$$

- Hence
we
conclude

$$\mu(A) > 0 =$$

which is

\iff

there
exists

$$n, m \in \mathbb{N}, n$$

$$x \in T^{-n}(A)$$

that is
there
exists
points in
 A return
back to
 A .

- The
contrapo
sitive of
the
above
stateme
nt is

$$\{T^{-n}(A) \mid i$$

- Thus we can
conclude by
the previous
argument

$$\mu(A_k) = 0 \implies$$
